1

DEFINITIONS

This card describes version 2.02.0 of **bash**.

Several typefaces are used to clarify the meaning:

- Serifa Bold is used for computer input.
- Serifa Italic is used to indicate user input and for syntactic placeholders, such as variable or cmd.
- Serifa Roman is used for explanatory text.

blank – separator between words. Blanks consist of one or more spaces and/or tab characters. In addition, words are terminated by any of the following characters:

; & () | < > space tab newline

command - a series of words.

list – one or more pipelines. Can be separated by ;, &, &&, &&, $\|$ and optionally be terminated by ;, &.

n – an integer

name – a variable, alias, function or command name.

keyword - a reserved word in the **bash** language. Keywords are special only after a; or newline, after another keyword, and in certain other contexts.

pat – a bash pattern. See Patterns.

pipeline – a command or multiple commands connected by a pipe (I).

string - a collection of characters treated as a unit.

substitution – the process of replacing parts of the command line with different text, e.g., replacing a variable with its value. **bash** performs many substitutions. This card lists them in the order they are performed.

word – a generic argument; a word. Quoting may be necessary if it contains special characters.

RESTRICTED bash

If **bash** is invoked as **rbash**, or with the **-r** option, it is restricted. The following actions are not allowed in a restricted shell:

changing directory with cd setting or unsetting \$SHELL or \$PATH using path names for commands that contain / using a path name that contains / for the . command importing functions from the environment parsing \$SHELLOPTS at startup redirecting output with any of >, >I, <>, >&, &>, or >> using exec to run a different command adding or deleting built-in commands with enable using command -p to bypass a restricted \$PATH using set +r or set +o restricted

These restrictions are in effect after executing all startup files, allowing the author of the startup files full control in setting up the restricted environment. (In practice, restricted shells are not used much, as they are difficult to set up correctly.)

Error Reporting

If you find an error in this reference and are the first to report it, we will send you a free copy of any of our references. Please write, or send electronic mail to bugs@ssc.com.

COMMAND LINE ARGUMENTS

bash accepts the one letter options to **set**, and the additional one letter and GNU-style long options shown below.

\$ bash [options] [args]

–i

ends option processingends option processing

-c cmd execute cmd (default reads

command from file named in first entry of ${\it args}$ and found via

path search)

-D print all double quoted strings

that are preceded by a \$ to stdout. This implies -n, no

commands are executed set interactive mode

-r set restricted mode

-s read commands from stdin

(default)

--dump-po-strings same as -D, but output in GNU

gettext format

--dump-strings same as -D

--help display a help message and exit

successfully

--login act like a login shell

--noediting do not use the readline library to read commands when

to read comminteractive

--noprofile do not read any of the

initialization files. See Invocation And Startup, below

--norc do not read \(^{\)/.bashrc if

interactive. See Invocation And

Startup, below

--posix follow the IEEE POSIX 1003.2

standard

--rcfile file use file instead of ~/.bashrc if

interactive

--restricted same as -r
--verbose same as set -v

--version print version information on

 \boldsymbol{stdout} and exit successfully

INVOCATION AND STARTUP

There are five ways that **bash** runs: normal interactive, normal non-interactive, as **sh**, in POSIX mode, or invoked via **rshd**.

1. Normal interactive: Login shells run commands in /etc/profile. The first of ~/.bash_profile, ~/.bash_login, and ~/.profile that is found is executed. This stage is skipped if --noprofile is used.

Upon logout, bash runs ~/.bash_logout if it exists.

Interactive non-login shells execute ~/.bashrc, if it exists. The --rcfile ifile option changes the file that is used.

2. Normal non-interactive: Non-interactive shells do variable, command, and arithmetic substitution on the value of **\$BASH_ENV**, and if the result names an existing file, that file is executed.

INVOCATION AND STARTUP (continued).

- 3. Invoked as **sh**: Interactive login shells read and execute /etc/profile and ~/.profile if they exist. These files are skipped if --noprofile is used. Interactive shells expand **SENV** and execute that file if it exists. Non-interactive shells do not read any startup files. After the startup files are executed, **bash** enters POSIX mode.
- 4. POSIX mode: When started with --posix, interactive shells expand **\$ENV** and execute the given file. No other startup files are read.
- 5. Invoked via **rshd**: If run from **rshd** and not invoked as **sh**, **bash** reads ~/.**bashrc**. The --norc option skips this step, and the --rcfile option changes the file, but **rshd** usually does not pass these options on to the shell it invokes.
- If **\$\$HELLOPTS** exists in the environment at startup, **bash** enables the given options.

PROMPTING

When interactive, **bash** displays the primary and secondary prompt strings, **\$P\$1** and **\$P\$2**. **bash** expands the following escape sequences in the values of these strings.

an ASCII BEL character (octal 07) ۱a \d the date in "Weekday Month Day" format an ASCII escape character (octal 033) \e \h the hostname up to the first dot (.) ŀΗ the full hostname \n a newline a carriage return ۱r the name of the shell (basename of \$0) ۱s \t the time in 24-hour HH:MM:SS format **\T** the time in 12-hour HH:MM:SS format \u the user's username the version of bash (e.g., 2.02) ١v ١v the version and patchlevel of bash (e.g., 2.02.0) \w the current working directory ١W the basename of the current working directory ۱! the history number of this command \# the command number of this command ۱Ś a # if the effective UID is 0, otherwise a \$ \@ the time in 12-hour am/pm format 11 a backslash \n the character corresponding to octal value nnn]۱ start a sequence of non-printing characters ١] end a sequence of non-printing characters

The history number is the number of the command in the history list, which may include commands restored from the history file. The command number is the number of this command starting from the first command run by the current invocation of the shell.

The default value of **PS1** is " $\s-\v-\$ ".

HISTORY SUBSTITUTION

History expansion is similar to **csh**'s. It is enabled by default in interactive shells. History expansion happens before the shell breaks the input into words, although quoting is recognized and quoted text is treated as one history "word".

History substitution is performed on history events, which consist of an event designator (which previous line to start with), a word designator (which word from that line to use, starting with zero), and one or more optional modifiers (which parts of the words to use). Colons separate the three parts, although the colon between the event designator and word designator may be omitted when the word designator begins with ^, \$, *, -, or %. Each modifier is separated from the next one with a colon. The histchars variable specifies the start-of-history and quick substitution characters, and also the comment character that indicates that the rest of a line is a comment. The previous command is the default event if no event designator is supplied.

The event designators are:

! start a history substitution

!n command line n

!-n current line minus n (n previous)

!! the previous command

!str most recent command line starting with

str

!?str[?] most recent command line containing str !# the entire command line typed so far

^old^new^ quick substitution: repeat last command

changing old to new

The word designators are:

0 the zero'th word (command name)

n word n

^ the first argument, i.e., word one

\$ the last argument

% the word matched by the most recent

!?str? search

x-y words x through y. -y is short for 0-y* words 1 through the last (like 1-\$) n^* words n through the last (like n-\$)

n— words n through the next to last

The modifiers are:

e remove all but the suffix of a filename

g make changes globally, use with s

modifier, below

h remove the last part of a filename,

leaving the "head"

p print the command but do not execute it

q quote the generated text

r remove the last suffix of a filename

s/old/new/ substitute new for old in the text. Any

delimiter may be used. An & in the replacement means the value of old. With empty old, use last old, or the most recent !?str? search if there was no previous old

remove all but the last part of a filename,

leaving the "tail"

x quote the generated text, but break into

words at blanks and newline

& repeat the last substitution

QUOTING				
\ C	quote single character c			
``	old style command substitution			
""	text trea	ted as a s	single argument, double	
	quotes re	emoved;	variable, command and	
			utions performed;	
	use \ to o	quote \$, \	., `, and "	
\$""	like "",	but loca	le translation done	
<i>`'</i>	text treated as a single argument, single			
	quotes removed; text between quotes			
	left alone	e, cannot	include '	
\$'' text treated as a single argument, \$ a				
	single quotes removed; no substitutions			
	performed; ANSI C and additional			
	escape sequences processed:			
\a	alert (bell)	\ v	vertical tab	
\b	backspace	\ ddd	octal value ddd	
\f	form feed	\x hhh	hex value hhh	
\n newline		//	backslash	
\r	carriage return \e escape, not in ANSI C		escape, not in ANSI C	
\t	horizontal tab			

ALIASING

alias name=value ...

Aliases are expanded when a command is read, not when executed. Alias names can contain any nonspecial character, not just alphanumerics, except for =. Alias expansion is done on the first word of a command. If the last character of the replacement text is a blank, then the next word in the command line is checked for alias expansion. Aliases can even be used to redefine shell keywords, but not in POSIX mode.

BRACE EXPANSION.

Brace expansion is similar to csh's. A word must contain at least one unquoted left brace and comma to be expanded. bash expands the comma-separated items in order, the result is not sorted. Brace expansions may be nested. For example:

\$ mkdir /usr/{gnu,local}/{src,bin,lib}

TILDE SUBSTITUTION

substitute \$HOME ~user substitute user's home directory substitute **\$PWD** substitute \$OLDPWD ~n substitute \${DIRSTACK[n]}. A leading + or - is allowed: negative values count from the end of the stack

Tilde substitution happens after alias expansion. It is done for words that begin with and for variable assignment.

In variable assignments, it is also done after a: in the value. Tilde substitution is done as part of word expansion. This means for \${name op word}, word will be checked for tilde substitution, but only if the operation requires the value of the right-hand side.

VARIABLE SUBSTITUTION

\$name reference to shell variable name \${name} use braces to delimit shell variable name

\${name - word}

use variable name if set, else use word

\${name = word}

as above but also set name to word

\${name?word}

use name if set, otherwise print word and

exit (interactive shells do not exit)

\${name + word}

use word if name is set, otherwise use

nothing

\${name[n]} element n in array name \${#name} length of shell variable name \${#name[*]} number of elements in array name \${#name[@]} number of elements in array name

\${name#pat} remove shortest leading substring

of name that matches pat

\${name##pat} remove longest leading substring

of name that matches pat

\${name%pat} remove shortest trailing substring

of name that matches pat

\${name%%pat}

remove longest trailing substring

of name that matches pat

\${name:start}

\${name:start:length}

length characters of name starting at start (counting from 0); use rest of value if no length. Negative start counts from the end. If name is * or @ or an array indexed by * or @, start and length indicate the array index and count of elements. start and length can be arithmetic expressions

\${name/pattern/string}

value of name with first match of pattern replaced with string

\${name/pattern}

value of name with first match of pattern

deleted

\${name//pattern/string}

value of name with every match of

pattern replaced with string

\${name/#pattern/string}

value of name with match of pattern replaced with string; match must occur

at beginning

\${name/%pattern/string} value of name with match of pattern

replaced with string; match occurs at end

Note: for -, =, ?, and +, using name: instead of name tests whether name is set and non-NULL; using name tests only whether name is set.

For #, ##, %, %%, /, //, /#, and /%, when name is * or @ or an array indexed by * or @, the substring or substitution operation is applied to each element.

_ARITHMETIC EVALUATION

Arithmetic evaluation is done with the **let** built-in command, the ((...)) command and the ((...)) expansion for producing the result of an expression.

All arithmetic uses **long** integers. Use **typeset** $-\mathbf{i}$ to get integer variables. Integer constants look like [base#]n where base is a decimal number between two and 64, and n is in that base. The digits are $\mathbf{0}$ - $\mathbf{9}$, \mathbf{a} - \mathbf{z} , \mathbf{A} - \mathbf{Z} , and @. A leading $\mathbf{0}$ or $\mathbf{0}$ x denote octal or hexadecimal.

The following operators based on C, with the same precedence and associativity, are available.

unary plus and minus logical and bitwise negation exponentiation (not in C) multiply, divide, modulus addition, subtraction left shift, right shift << >> < <= > >= comparisons equals, not equals == != bitwise AND & bitwise XOR bitwise OR logical AND, short circuit &&

Inside let, ((...)), and \$((...)), variable names do not need a \$ to get their values.

COMMAND SUBSTITUTION

\$(command) new form old form

Run *command*, substitute the results as arguments. Trailing newlines are removed. Characters in **\$IFS** separate words (see Field Splitting). The new form is preferred for simpler quoting rules.

\$((expression)) arithmetic substitution

The expression is evaluated, and the result is used as an argument to the current command.

PROCESS SUBSTITUTION

cmd < (list1) > (list2)

Runs *list1* and *list2* asynchronously, with **stdin** and **stdout** respectively connected via pipes using fifos or files in /**dev/fd**. These file names become arguments to *cmd*, which expects to read its first argument and write its second. This only works if you have /**dev/fd** or fifos.

FIELD SPLITTING

Ouoted text becomes one word. Otherwise, occurrences of any character in SIFS separate words. Multiple whitespace characters that are in SIFS do not delimit empty words, while multiple non-whitespace characters do. When SIFS is not the default value, sequences of leading and trailing SIFS whitespace characters are removed, and printable characters in SIFS surrounded by adjacent SIFS whitespace characters delimit fields. If SIFS is NULL, bash does not do field splitting.

PATTERNS

?	match single character in filename		
*	match 0 or more characters in filename		
[chars]	match any of chars		
	(pair separated by a - matches a range)		
F			

[!chars]match any except chars[chars]match any except chars

If the **extglob** option to **shopt** is set, the following extended matching facilities may be used.

?(pat-list)	optionally match any of the patterns
*(pat-list)	match 0 or more of any of the patterns
+(pat-list)	match 1 or more of any of the patterns
@(pat-list)	match exactly 1 of any of the patterns
!(pat-list)	match anything but any of the patterns

pat-list is a list of one or more patterns separated by I.

The POSIX [[=c=]] and [[.c.]] notations for same-weight characters and collating elements are accepted. The notation [[:class:]] defines character classes:

alnum	alphanumeric	lower	lower-case
alpha	alphabetic	print	printable
blank	space or tab	punct	punctuation
cntrl	control	space	whitespace
digit	decimal	upper	upper-case
graph	non-spaces	xdigit	hexadecimal

Three shopt options affect pattern matching.

dotglobinclude files whose names begin with .nocaseglobignore case when matchingnullglobremove patterns that don't match

When expanding filenames, . and .. are ignored, filenames matching the patterns in **\$GLOBIGNORE** are also ignored and a leading . must be supplied in the pattern to match filenames that begin with . . However, setting **GLOBIGNORE** enables the **dotglob** option. Include .* in **GLOBIGNORE** to get the default behavior.

VARIABLE NAMES

Variable names are made up of letters, digits and underscores. They may not start with a digit. There is no limit on the length of a variable name, and the case of letters is significant.

VARIABLE ASSIGNMENT

Assignments to integer variables undergo arithmetic evaluation. Variable assignments have one of the following forms.

name = word set name to word name[index] = word

set element index of array name to word name = (word ...)

set indexed array name to words

name =([num]=word ...)

set given indices of array name to words

PRE-	-DEFINED VARIABLES	
\$ n	use positional parameter $n, n \leq 9$	
\$ {n}	use positional parameter n	
\$*	all positional parameters	
\$@	all positional parameters	
"\$*"	equivalent to "\$1 \$2"	
"\$@"	equivalent to "\$1" "\$2"	
\$#	number of positional parameters	
\$-	options to shell or by set

PRE-DEFIN	ED VARIABLES (continued)
\$HISTCMD	history number of the current
	command
\$HISTCONTROL	with a value of ignorespace, do not
	enter lines that begin with spaces
	into the history file. With a value of
	ignoredups, do not enter a line that
	matches the previous line. Use
ČIII CORRII E	ignoreboth to combine both options
SHISTFILE SHISTFILESIZE	where command history is stored maximum number of lines to keep in
\$UI914IF9I7F	SHISTFILE
SHISTIGNORE	colon-separated list of patterns; if the
QIIID I I GITOILE	current line matches any of them, the
	line is not entered in the history file.
	& represents the last history line.
	Patterns must match the whole line
\$HISTSIZE	number of previous commands to
 	keep available while bash is running
\$HOME	home directory for cd command and
A	value used for tilde expansion
\$HOSTFILE	file in format of /etc/hosts to use for hostname completion
SHOSTNAME	name of the current host
SHOSTTYPE	string describing the current host
\$IFS	field separators (space, tab, newline)
SIGNOREEOF	for interactive shells, the number of
	consecutive EOFs that must be
	entered before bash actually exits
\$INPUTRC	name of readline startup file,
	overrides ~/.inputrc
\$LANG	name of current locale
\$LC_ALL	current locale; overrides \$LANG and
\$LC_COLLATE	other \$LC _ variables current locale for character collation,
SEC_COLLAIE	includes sorting results of filename
	expansion
\$LC_CTYPE	current locale for character class
-	functions (see Patterns)
\$LC_MESSAGES	current locale for translating \$""
	strings
\$LINENO	line number of line being executed in
43.5.4.63.53.5	script or function
\$MACHTYPE	a string in GNU cpu-company-system
	format describing the machine running bash
SMAIL	name of a mail file, if any
\$MAILCHECK	check for mail every <i>n</i> seconds (60)
7	default)
\$MAILPATH	filenames to check for new mail; uses
	: separator; filename may be followed
	by ?message; \$ _ in message is
	matched mail file name. Overrides
401 001	\$MAIL
\$OLDPWD	previous working directory
\$OPTARG	value of last argument processed by
\$OPTERR	<pre>getopts if set to 1, display error messages</pre>
OLIENN	from getopts (default: 1)
\$OPTIND	index of last argument processed by
	getopts

PRE-DEFINED	VARIAB	LES (continued)
\$∩\$TVDF	etring	describing

operating system running

bash

\$PATH command search path

\$PIPESTATUS[*] array variable containing exit

status values from processes in the most recently executed

foreground pipeline

process id of shell's parent \$PPID

\$PROMPT_COMMAND command to run before each

primary prompt

\$PS1 primary string prompt

(\s-\v\\$)

\$PS2 secondary prompt string (>) \$PS3

select command prompt

string (#?)

\$PS4 tracing prompt string (+) \$PWD current working directory \$RANDOM set each time it's referenced,

0 - 32767

\$REPLY set by the select and read

commands

\$SECONDS number of seconds since shell

invocation

\$SHELL name of this shell

\$SHELLOPTS colon-separated list of the

enabled shell options for set

\$SHLVL incremented by one for each

sub-bash

STIMEFORMAT

format string for output of time keyword. Special constructs introduced by %.

%[p][1]Relapsed secs user CPU secs %[p][1]**U** system CPU secs %[p][1]**S** %**P** CPU percentage

%% literal %

Optional p gives the precision, the number of digits after the decimal point; it must be between 0 and 3. Optional 1 produces a longer format, in

the form MMmSS.FFs

\$TMOUT number of seconds to wait

during prompt before

terminating

\$UID the real user id (readonly)

FUNCTIONS.

Functions run in the same process as the calling script, and share the open files and current directory. They access their parameters like a script, via \$1, \$2 and so on. \$0 does not change. return may be used inside a function or . script. Functions share traps with the parent script, except for DEBUG. Functions may be recursive, and may have local variables, declared using declare, local, or typeset. Functions may be exported into the environment with export -f.

_INPUT/OUTPUT

Redirections are done left to right, after pipes are set up. Default file descriptors are **stdin** and **stdout**. File descriptors above 2 are marked close-on-exec.

&>word send stdout and stderr to word >&word send stdout and stderr to word [n]<file use file for input [n]>file use file for output [n]>Ifile like >, but overrides noclobber [n]>>filelike > but append to file if it exists [n]<>file open file for read/write (default: fd0) duplicate input file descriptor from m[n]**<&**m duplicate output file descriptor from m[n]>&m [n]<&close input file descriptor [n]>&close output file descriptor [n]<<word

input comes from the shell script; treat a line with *word* as EOF on input. If any of *word* is quoted, no additional processing is done on input by the shell. Otherwise:

- do variable, command, arithmetic substitutions
- ignore escaped newlines
- use \ to quote \, \$, `, and first character of word [n]<<- word as above, but with leading tabs ignored

Of &> and >&, the first is preferred. It is equivalent to >word 2>&1.

EXECUTION ORDER

All substitutions and I/O redirections are performed before a command is actually executed.

bash maintains an internal hash table for caching external commands. Initially, this table is empty. As commands are found by searching the directories listed in **SPATH**, they are added to the hash table.

The command search order is shell functions first, builtin commands second, and external commands (first in the internal hash table, and then via **SPATH**) third.

SIGNALS AND TRAPS

Signal handling is done with the **trap** built-in command. The *word* argument describing code to execute upon receipt of the signal is scanned twice by **bash**; once when the **trap** command is executed, and again when the signal is caught. Therefore it is best to use single quotes for the **trap** command. Traps are executed in order of signal number. You cannot change the status of a signal that was ignored when the shell started up.

Traps on **DEBUG** happen after commands are executed.

Backgrounded commands (those followed by &) will ignore the SIGINT and SIGOUIT signals if the monitor option is turned off. Otherwise, they inherit the values of the parent bash.

ARRAYS

Arrays in **bash** have no limits on the number of elements. Array indices start at 0. Array subscripts can be arithmetic expressions. Array elements need not be contiguous. **bash** does not have associative arrays.

CONTROL COMMANDS

! pipeli

execute *pipeline*. If exit status was non-zero, exit zero. If exit status was zero, exit 1

case word **in** [[(]pat1[lpat2]...) list ;;]... **esac**

execute *list* associated with *pat* that matches *word*. Field splitting is not done for *word*. *pat* is a **bash** pattern (see Patterns). I is used to indicate an OR condition. Use leading (if **case** is inside \$()

for name [in words]; do list; done

sequentially assign each word to name and execute list. If in words is missing use the positional parameters

[function] func() { list; }

define function func, body is list (see Functions)

if list1; then list2 [; elif list3; then list4]...[; else list5]; fi
if executing list1 returns successful exit status,
execute list2 else ...

select name [in words]; do list; done

print a menu of words, prompt with \$PS3 and read a line from stdin, saving it in \$REPLY. If the line is the number of one of the words, set name to it, otherwise set name to NULL. Execute list. If in words is missing use the positional parameters. bash automatically reprints the menu at the end of the loop

time [-p] pipeline

execute *pipeline*; print elapsed, system and user times on **stderr**.

-p print times in POSIX format

The \$TIMEFORMAT variable controls the format of the output if -p is not used. bash uses the value \$'\nreal\t%3lR\nuser\t%3lU\nsys\t%3lS' if there is no value for \$TIMEFORMAT

until list1; do list2; done

like while but negate the termination test

while list1; do list2; done

execute *list1*. If last command in *list1* had a successful exit status, execute *list2* followed by *list1*. Repeat until last command in *list1* returns an unsuccessful exit status

((...))

arithmetic evaluation, like let "..."

[[expression]]

evaluate expression, return successful exit status if true, unsuccessful if false (see Conditional Expressions for details)

(list)

execute *list* in a sub-shell

{ *list* ; }

execute list in the current shell

CONDITIONAL EXPRESSIONS

Used with the [[...]] compound command, which does not do pattern expansion or word splitting. true if string is not NULL string −a file true if file exists (-e is preferred) −**b** file true if file is a block device −c file true if file is a character device −**d** file true if file is a directory true if file exists -e file **−f** file true if file is a regular file −**g** file true if file has setgid bit set −**G** file true if file group is effective gid true if file is a symbolic link **-h** file -k file true if file has sticky bit set **−L** file true if file is a symbolic link true if string has non-zero length -n string −N file true if file exists and was modified since last read -o option true if option is on -O file true if file owner is effective uid true if file is a fifo (named pipe) −p file −**r** file true if file is readable -s file true if file has non-zero size **−S** file true if file is a socket -t filedes true if filedes is a terminal true if file has setuid bit set -u file −w file true if file is writable −**x** file true if file is executable true if string has zero length -z string file1 **-nt** file2 true if file1 is newer than file2 or file2 does not exist file1 -ot file2 true if file1 is older than file2 or file2 does not exist true if file1 and file2 are the same file file1 **-ef** file2 string == pattern true if string matches pattern string != pattern true if string does not match pattern string1 < string2 true if string1 is before string2 string1 > string2 true if string1 is after string2 exp1 -eq exp2 true if exp1 equals exp2 exp1 -ne exp2 true if exp1 does not equal exp2 exp1 -lt exp2 true if exp1 is less than exp2 exp1 -gt exp2 true if exp1 is greater than exp2 exp1 -le exp2 true if exp1 is less than or equal to exp2 exp1 -ge exp2 true if exp1 is greater than or equal to exp2 (expression) true if expression is true, for grouping ! expression true if expression is false exp1 && exp2 true if exp1 AND exp2 are true true if exp1 OR exp2 is true exp1 | exp2

If file is /dev/fd/n, then, if there is no /dev/fd directory, file descriptor n is checked. Otherwise, the real /dev/fd/n file is checked. Linux, FreeBSD, BSD/OS (and maybe others) return info for the indicated file descriptor, instead of the actual /dev/fd device file.

Both && and || are short circuit. Operands of comparison operators undergo arithmetic evaluation. For == and !=, quote any part of pattern to treat it as a string.

BUILT-IN COMMANDS_

```
These commands are executed directly by the shell.
Almost all accept -- to mark the end of options.
file
source file
   read and execute commands from file.
                                                         If
    arguments, save and restore positional params.
    Search $PATH; if nothing found, look in the current
   directory
    null command; returns 0 exit status
   see test
alias [-p] [name[=value] ...]
    create an alias. With no arguments, print all
   aliases. With name, print alias value for name
               print alias before each alias
bg [jobid]
   put jobid in the background
bind [-m map] [-lpPsSvV]
\textbf{bind} \; [-\textbf{m} \; \textit{map}] \; [-\textbf{q} \; \textit{func}] \; [-\textbf{r} \; \textit{keyseq}] \; [-\textbf{u} \; \textit{func}]
bind [-m map] -f file
bind [-m map] keyseq:func
    display and/or modify readline function and key
    bindings. The syntax is same as for \(^{\)\.inputrc
    −f file
               read new bindings from file
               list the names of all readline functions
    -1
    -m map
               use the keymap map
               list readline functions and bindings
    -p
               for re-reading
    -P
               list readline functions and bindings
               show which keys invoke func
    −q func
    -\mathbf{r} keyseq
               remove bindings for keyseq
               list readline key sequences and macros
    -s
               for re-reading
    -S
               list readline key sequences and macros
    -u func
               remove key bindings for func
               list readline variable names and values
    -v
               for re-reading
    -v
               list readline variable names and values
break [n]
    exit from enclosing for, while, until or select loop.
    If n is supplied, exit from n'th enclosing loop
builtin shell-builtin [ args ...]
    execute shell-builtin with given args and return
    status. Useful for the body of a shell function that
    redefines a built-in, e.g., cd
cd [-LP] [dir]
    change current directory to dir ($HOME default).
   Do directory path search using value of \mbox{\tt \$CDPATH}
               use logical path for cd .., $PWD (default)
    -P
               use physical path for cd .., $PWD
   If both are given, the last one on the command line
    wins
cd [-LP] -
    change current directory to $OLDPWD
command [-pvV] name [arg ...]
    without -v or -V, execute name with arguments arg
               use a default search path, not $PATH
    -p
               print a one word description of name
    -v
    -V
               print a verbose description of name
continue [n]
    do next iteration of enclosing for, while, until or
    select loop. If n is supplied, iterate n'th enclosing
   loop
```

```
BUILT-IN COMMANDS (continued)
declare [±afFirx] [-p] [name[=value]]
typeset [±afFirx] [-p] [name[=value]]
    set attributes and values of variables. Inside
    functions, create new copies of the variables. Using
   + instead of - turns attributes off. With no names
    or attributes, print every variable's name and
    attributes
               name is an array
    -f
               each name is a function
    -\mathbf{F}
               don't show function definitions (bodies)
    -i
               name is an integer; arithmetic
               evaluation is done upon assignment
    -r
               mark names readonly
               mark names for export
    -x
dirs [-clpv] [+n] [-n]
    display the directory stack
               show n'th entry from left, n \ge 0
    +n
    -n
               show n'th entry from right, n \ge 0
               clear the directory stack
    -c
    -1
               print a longer format listing
               print the stack one entry per line
    -p
               print the stack one entry per line, with
    -17
               index numbers
disown [-ar] [-h] [job ...]
    with no options, remove named jobs from the table
   of active jobs
               remove or mark (with -h) all jobs
    -a
    -h
               mark each job to not receive a SIGHUP
               when bash terminates
               use with -h to mark just running jobs
echo [-eEn] [words]
    echo words; -- is not special
               expand \-escapes (see echo(1))
    -\mathbf{E}
               never expand \-escapes
    -n
               don't output trailing newline
    printf is more portable
enable [-adnps] [-f file] [name ...]
    enable and disable shell built-ins, or load and
    unload new built-ins from shared library files.
    Disabling a built-in allows use of a disk file with the
    same name as a built-in
               print all built-ins, with their status
               delete a built-in loaded with -\mathbf{f}
    -d
    −f file
               load a new built-in name from file
               disable name, or print disabled built-ins
    -n
               with no names
               print enabled built-ins
    -p
               print only POSIX special built-ins
    -s
eval [words]
    evaluate words and execute result
exec [-a name] [-cl] [words]
    execute words in place of the shell. If redirections
    only, change the shell's open files
    -a
               use name for argv[0]
    -c
               clear the environment first
               place a - on argv[0] (like login(1))
    -1
    If the exec fails, non-interactive shells exit, unless
```

the shopt option execfail is set

exit with return value n. Use \$? if no n

exit [n]

```
BUILT-IN COMMANDS (continued)
export [-fnp] [name[=value] ...]
    with no arguments, print names and values of
    exported variables. Otherwise, export names to the
    environment of commands
    -f
               names refer to functions
    -n
               stop exporting each name
               print export before each variable
    -p
fc [-e editor][-nlr][first [last]]
   print a range of commands from first to last from last
    $HISTSIZE commands
               run editor if supplied; if not, use first of
    -е
               $FCEDIT, $EDITOR, or vi on
               commands; execute result(s)
    -1
               list on standard output instead of editing
               don't print line numbers
    -n
    -r
               reverse order of commands
fc -s [old=new] [command]
    substitute new for old in command (or last command
    if no command) and execute the result
fg [jobid]
   put jobid in the foreground
getopts optstring name [arg ...]
    parse parameters and options (see bash(1))
hash [-r] [-p file] [name]
    with no arguments, print the hash table contents,
    giving hit count and file name
               enter file for name in the hash table
    −p file
    -r
               clear the internal hash table
    Assignment to $PATH also clears the hash table
help [pattern]
    print help. With pattern, print help about all the
    commands that match pattern
history[n]
history -anrw [file]
history [-c]
history -p arg [...]
history -s arg [...]
    with no options, print the command history. An
    argument of n prints only n lines. If supplied, use
    file instead of $HISTFILE
               append new history lines to history file
    -a
    -c
               clear the history list
               read new history lines in the file into the
    -n
               internal history list
               perform history substitution and print
    -p
               the results
               replace internal history with contents of
               history file
               place the args into the history list
    -s
               for later use
               write the internal history to the file
    -w
jobs [-lnprs] [jobid ...]
iobs -x command [args ...]
   list information about jobs
    -1
               also list process id
               only list stopped or exited jobs
    -n
               only list process groups
    -p
    -r
               only list running jobs
               only list stopped jobs
    -s
               replace any jobid in the command line
    -x
```

and execute the command

with the corresponding process group ID,

```
BUILT-IN COMMANDS (continued)
kill [-sig] jobid ...
kill [-s signame] [-n signum] jobid ...
    send SIGTERM or given signal to named jobids.
   Signals are names listed in /usr/include/signal.h
   with or without the prefix "SIG". Stopped jobs get
   a SIGCONT first if sig is either SIGTERM or
   SIGHUP
kill -l [sigs ...]
   list signal names and/or numbers. If sig is a
   numerical exit status, print the signal that killed the
   process
let arg ...
    evaluate each arg as an arithmetic expression; exit 0
   if the last expression was non-zero, 1 otherwise
   (see Arithmetic Evaluation)
local [name[=value] ...]
   create variables with the given values local to a
   function. With no operands, print a list of local
   variables. Must be used inside a function
logout
   exit a login shell
popd [-n] [+n] [-n]
   remove entries from the directory stack. With no
   arguments, remove the top entry and cd there
              remove n'th entry from left, n \ge 0
   -n
              remove n'th entry from right, n \ge 0
              don't change directory
   -n
printf format [arg ...]
   print output like ANSI C printf, with extensions
    %b
              expand escape sequences in strings
    %ф
              print quoted string that can be re-read
   Format conversions are reused as needed
pushd [-n] [dir]
pushd [-n] [+n] [-n]
   add an entry to the directory stack. With no
   arguments, exchange the top two entries
              rotate the stack so that the n'th
              entry from left is at the top, n \ge 0
   -n
              rotate the stack so that the n'th
              entry from right is at the top, n \ge 0
              don't change directory
   -n
              push dir on the stack and cd there
   dir
pwd [-LP]
   print working directory name
              print logical path (default)
    -P
              print physical path
   If both are given, the last one on the command line
   wins
read [-a name] [-er] [-p prompt] [names ...]
   read stdin and assign to names. $IFS splits input.
   $REPLY is set if no name given. Exit 0 unless end-
   of-file encountered
              read words into indexed array name
    -a
```

before reading

continuation

use readline if reading from a terminal

print prompt if reading from a terminal

\ at end of line does not do line

-е -р

```
BUILT-IN COMMANDS (continued).
readonly [-afp] [name=value ...]
   mark names read-only; print list if no names
               each name must be an array
   -f
               each name must be a function
               print readonly before each variable
   -\mathbf{p}
return [n]
   exit function or . script with return value n. With no
   n, return status of last command. If not in function
   or . script, print an error message
set [-options] [-o option] [words]
   set flags and options (see Options To set). words set
   positional parameters
set [+options] [+o option] [words]
   unset flags and options
shift [n]
   rename positional parameters; n+1=1 ...
   n defaults to 1
shopt [-opqsu] [option ...]
   print or change values of shell options. With no
   arguments, print shell option information
              only change set -o options
    -0
               print settings for re-reading
    -p
               quiet mode; exit status indicates
    -q
               option status
               set (enable) given option; with no
               options, print those that are set
               unset (disable) given option; with no
    -u
               options, print those that are unset
   (See Options To shopt)
suspend [-f]
   suspend the shell until SIGCONT is received
              force suspension, even for login shell
test
   evaluate conditional expressions (see Options To
   test and Conditional Expressions)
   print accumulated process times
trap [-lp] [word] [sigs]
   execute word if signal in sigs received. sigs are
   numbers or signal names with or without "SIG".
   With no word or sigs, print traps. With no word,
   reset sigs to entry defaults. If word is "-", reset sigs
   to entry defaults. If word is the null string, ignore
   sigs. If sigs is 0 or EXIT, execute word on exit from
   shell. If sigs is DEBUG, run word after every
   command.
              print a list of signal names and numbers
   -1
    -p
              print traps with quoting
```

describe how the shell interprets name

type [-apt] name ...

print the name of the file to execute if -p

name is an external program

print all possible interpretations

-t print a keyword describing name

BUILT-IN COMMANDS (continued) ulimit [type] [options] [limit] set or print per-process limits type (default is both): -H hard limit -S soft limit options: all (display only) -a core file size -d "k" of data segment -f maximum file size -m "k" of physical memory -n maximum file descriptor + 1 -**p** size of pipe buffers -s "k" of stack segment -t cpu seconds -u max processes for one user -v "k" of virtual memory -f is assumed if no options are given. The size for -p is in 512-byte blocks; the others are in sizes of 1024 bytes umask [-pS] [mask] set file creation permissions mask to complement of mask if octal, or symbolic value as in chmod. With no arguments, print current mask. An octal mask is permissions to remove, a symbolic mask is permissions to keep print output for re-reading -p -S print current mask in symbolic form unalias [-a] [names] remove aliases names remove all aliases unset [-fv] [names] unset variables names (same as -v) unset functions names -f

_OPTIONS TO test

wait for job jobid; if no job, wait for all children

unset variables names

OPTIND, RANDOM, SECONDS, TMOUT and _ removes their special meaning, even if used

MAILCHECK,

OPTARG.

LINENO.

The **test** command, and its synonym [...], are built-in to **bash**. The command accepts all of the options listed in the Conditional Expressions section. However, since it is a command, options and arguments must be quoted to get proper behavior, and normal pattern expansion and field splitting are done. Parentheses used for grouping must be quoted. Arithmetic expansion is not done for numeric operators, and pattern matching is not done for == and !=. **test** complies with POSIX.

The -a and -o options have the following meanings, instead of the ones listed in Conditional Expressions:

-a logical AND-o logical OR

-v

Unsetting

afterwards wait [jobid ...]

OPTIONS TO set

The **set** command is complicated. Here is a summary. Use + instead of - to turn options off. With no arguments, **set** prints the names and values of all variables.

zanabies	S.		
set [±ab]	et [±abBCefhHkmnpPtuvx] [±o option] [arg]		
-a	automatically export variables upon		
	assignment		
-b	print job completion messages		
	immediately, don't wait for next prompt		
-B	enable brace expansion (default)		
-C	force >I to overwrite for existing files		
-е	exit upon non-zero exit from a command		
-f	disable pattern expansion		
-h	save command locations in the		
	internal hash table (default)		
-H	enable !-style history (default)		
-k	place all variable assignments in		
	the environment (obsolete)		
-m	run background jobs in their own		
	process group, print a message		
	when they exit; set automatically for		
	interactive shells on job control systems		
-n	read commands without executing them		
	(ignored if interactive)		
-o	set options; with no arguments, print		
	current settings		
	allexport same as -a		
	braceexpand same as -B		
	emacs use an <i>emacs</i> -style line		
	editor (default)		
	errexit same as -e		
	hashall same as -h		
	histexpand same as -H		
	history enable history		
	ignoreeof like IGNOREEOF=10		
	keyword same as -k		
	monitor same as -m		
	noclobber same as -C		
	noexec same as -n		
	noglob same as -f		
	notify same as -b		
	nounset same as -u		
	onecmd same as -t physical same as -P		
	posix obey the POSIX 1003.2		
	standard		
	privileged same as -p		
	verbose same as -v		
	vi use a <i>vi</i> -style line editor		
	xtrace same as -x		
-p	don't read SENV , do not take shell		
•	functions from environment, and ignore		
	options in \$\$HELLOPTS environment		
	variable		
-P	follow the physical directory structure		
	for commands that change the directory		
-t	read and execute one command,		
	then exit		
-u	make it an error to substitute an unset		
	variable		
-v	print input lines as they're read		

OPTIONS TO set (continued)

-x	print commands as they're executed,
	preceded by expanded value of \$PS4.
	Output is quoted for later reuse
_	turn off -v, -x, stop looking for flags;
	any remaining args set the
	positional parameters
	do not change flags; set positional
	parameters from argument list;
	with no args, unset the positional
	parameters

OPTIONS TO shopt.

The **shopt** command sets or unsets a number of options that affect how **bash** behaves. This section describes each option's effect when enabled. Unless noted, they are all disabled by default.

cdable_vars

treat an argument to **cd** that is not a directory as a variable whose value is the directory name

cdspell

attempt to correct minor spelling errors in arguments to **cd**. Errors tried are transposed characters, a missing character or an extra character. Only obeyed in interactive shells

checkhash

check that a command in the hash table still exists before trying to execute it. If it doesn't, search SPATH

checkwinsize

check the window size after each command and update ${\bf \$LINES}$ and ${\bf \$COLUMNS}$

cmdhist

attempt to save all lines of a multi-line command in the history file as one line, for easy re-editing $\,$

dotglob

include files whose names begin with . in path expansions $% \left(1\right) =\left(1\right) \left(1\right) \left($

execfail

keep non-interactive shells from exiting when **exec** fails

expand_aliases

expand aliases as described in Aliases. Enabled automatically in interactive shells

extglol

enable the extended pattern matching facilities (see Patterns) $\,$

histappend

append the current history to **\$HISTFILE** upon exit, instead of overwriting it

histreedit

if using **readline** and a history substitution fails, the user can re-edit the line

histverify

if using ${\bf readline}$, load the results of history substitution into ${\bf readline}$ for further editing

hostcomplete

if using $\boldsymbol{readline},$ attempt host completion on word containing @

huponexit

send **SIGHUP** to all jobs when **bash** exits

interactive_comments

in interactive shells, a word starting with # starts a comment. Enabled by default

OPTIONS TO shopt (continued) _

lithist

if $\mbox{cmdhist}$ is also enabled, save multi-line commands with newlines, not semi-colons

mailwarn

print a warning message if a file being checked for mail was accessed since the last time it was checked

nocaseglob

do a case-insensitive match when expanding pathnames $% \left(\frac{1}{2}\right) =\left(\frac{1}{2}\right) ^{2}$

nullglob

remove patterns that don't match any file, instead of leaving them unchanged in the command line

promptvars

do parameter expansion on the prompt variables before printing them. Enabled by default

shift_verbose

print an error message when the shift count is greater than the number of positional parameters $% \left(1\right) =\left(1\right) \left(1\right)$

sourcepath

use $\mbox{\bf \$PATH}$ to find shell files given to the . and $\mbox{\bf source}$ commands. Enabled by default

SPECIAL CHARACTERS

SPECIAL CHARACTERS				
#	start of comment; terminated by newline			
I	(pipe) connects two commands			
;	command separator			
&	run process in background; default stdin			
	from /dev/null if no job control			
&&	only run following command if previous			
	command completed successfully			
П	only run following command if previous			
	command failed			
•	enclose string to be taken literally			
II	enclose string to have variable, command			
	and arithmetic substitution only			
\$()	in-line command substitution (new style)			
`	in-line command substitution (old style)			
(())	arithmetic evaluation, like let ""			
\$(())	in-line arithmetic evaluation			
\	treat following character literally			
\newline	line continuation			

JOB IDS AND JOB CONTROL

Jobs can be represented as follows:

jobid %% %+ %- %?str %n %pref	the job identifier for a job, where: current job current job previous job job uniquely identified by str job number n job whose command line begins
*	with pref

Usually, a process ID may be used instead of a *jobid*. Commands that take a *jobid* use the current job if no *jobid* is supplied.

Traps on SIGCHLD execute whenever a job completes.

The commands \mathbf{fg} and \mathbf{bg} are only available on systems that support job control. This includes Linux, BSD systems, System V Release 4, and most UNIX systems.

READLINE

The readline library implements command line editing. By default, it provides an emacs editing interface, although a vi interface is available. readline is initialized either from the file named by \$INPUTRC (if set), or from $\tilde{\ }$ /.inputrc. In that file, you can use conditionals, define key bindings for macros and functions, and set variables.

From the bash level, the bind command allows you to add, remove and change macro and key bindings. There are five input mode map names that control the action taken for each input character. The map names are emacs, emacs-standard, emacs-meta, emacs-ctlx, vi, vi-command, and vi-insert. emacs is the same as emacs-standard, and vi is the same as vi-command.

You choose which editor you prefer with set -o emacs or **set -o vi** in your ~/.bashrc file, or at runtime.

readline understands the character names DEL, ESC, LFD, NEWLINE, RET, RETURN, RUBOUT, SPACE, SPC and TAB.

READLINE DIRECTIVES

Directives in the .inputrc file provide conditional and include facilities similar to the C preprocessor.

include a file, e.g., a system-wide /etc/inputrc file \$if

start a conditional, for terminal or application specific settings. You can test the following:

application= test the application, e.g. bash or gdb mode= test the editing mode, emacs or vi term= test the terminal type

The use of application = is optional; e.g., \$if Bash

\$else

start the "else" part of a conditional

Sendif

finish a conditional

READLINE KEY BINDINGS

Keys bound to a macro place the macro text into the input; keys bound to a function run the function.

You can use these escape sequences in bindings:

\a alert (bell) carriage return horizontal tab (TAB) \b backspace \t. \Ccontrol prefix \ν vertical tab \d delete (DEL) backslash // literal " \e escape (ESC) ۱f form feed literal ' octal value ddd \Mmeta prefix \ddd newline **\x**hhh hex value hhh \n

Macros and function bindings look like:

macro: key-seq:"text" key-seq:function-name function:

Macros have quoted text on the right of the colon; functions have function names. A key-seq is either a single character or character name (such as Control-o), or a quoted string of characters (single or double auotes).

READLINE VARIABLES

Variables control different aspects of **readline**'s behavior. You set a variable with

set variable value

Unless otherwise noted, value should be either **On** or **Off**. The descriptions below describe the effect when the variable is **On**. Default values are shown in parentheses.

bell-style (audible)

defines how readline should ring the bell:

audible ring the bell
none never ring the bell
visible flash the screen

comment-begin (#)

insert this string for **readline-insert-comment**, (bound to **M**-# in *emacs* mode and to # in *vi* mode)

completion-ignore-case (Off)

ignore case when doing completions

completion-query-items (100)

if the number of completion items is less than this value, place them in the command line. Otherwise, ask the user if they should be shown

convert-meta (On)

treat characters with the eighth bit set as the meta version of the equivalent seven bit character

disable-completion (Off)

do not do completion

editing-mode (emacs)

set the initial editing mode. Possible values are \mathbf{emacs} or \mathbf{vi}

enable-keypad (Off)

attempt to enable the application keypad. This may be needed to make the arrow keys work

expand-tilde (Off)

attempt tilde expansion as part of word completion

input-meta (Off)

meta-flag (Off)

enable eight bit input. The two variable names are synonyms

keymap (emacs)

set the current keymap. See Readline for a list of allowed values. The **editing-mode** variable also affects the keymap

mark-directories (On)

append a / to completed directory names

mark-modified-lines (Off)

place a * at the front of modified history lines

output-meta (Off)

print characters with the eighth bit set directly, not as $\boldsymbol{M}\text{-}\boldsymbol{x}$

print-completions-horizontally (Off)

display completions horizontally, with the matches sorted alphabetically, instead of vertically down the screen

show-all-if-ambiguous (Off)

immediately list words with multiple possible completions, instead of ringing the bell

visible-stats (Off)

when listing possible completions, append a character that denotes the file's type

More information about **readline** can be found on-line at **http://www.ssc.com/ssc/bash**.
